SIMILARITY: Contains 2 immunoglobulin-like C1-type domain. SIMILARITY: Contains 1 immunoglobulin-like V-type domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Binds JAK2 irrespective of its phosphorylation status ar stable complex. Binds SCAP1 and/or SCAP2. The resulting recruits FYB. Binds FGR and FYESE (By similarity). SUBCELLULAR LOCATION: Type I membrane protein. TISSUE SPECIFICITY: Highly expressed in spleen macrophag Detected in skin dendritic cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      dendritic cells and inhibits cytokine production by mature dendritic cells and inhibits cytokine production by mature dendritic cells (By similarity).

SUBUNIT: Binds PTPNI1 when tyrosine-phosphorylated, except in macrophages, where it primarily binds PTPN6. Binds GRB2 in vitro.

Binds JAK2 irrespective of its phosphorylation status and forms a binds JAK2 irrespective of its phosphorylation status and forms a binds JAK2 irrespective of its phosphorylation status and forms a binds JAK2 irrespective of its phosphorylation status and forms a binds JAK2 irrespective of its phosphorylation status and forms a binds JAK2 irrespective of its phosphorylation status and forms a binds JAK2 irrespective of its phosphorylation status and forms a binds JAK2 irrespective of its phosphorylation status and forms a binds JAK2 irrespective of its phosphorylation status and forms a binds JAK2 irrespective of its phosphorylation status and forms a binds JAK2 irrespective of its phosphorylation status and forms a binds JAK2 irrespective of its phosphorylation status and forms a binds JAK2 irrespective of its phosphorylation status and forms a binds JAK2 irrespective of its phosphorylation status and forms a binds JAK2 irrespective of its phosphorylation status and forms a binds JAK2 irrespective of its phosphorylation status and forms a binds JAK2 irrespective of its phosphorylation status and forms a binds JAK2 irrespective of its phosphorylation status and binds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  European Bioinformatics Institute.

Natl. Acad. Sci. U.S.A. 68:590-594(1971)

MISCELLANEOUS: The MOPC 315 cell line produces 2 light chains, 1 normal lambda-2 chain and 1 abnormal lambda-1 chain that is missing a large part of the V region. The C region sequence (shown here) appears completely normal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     here) appears completely normal.
SIMILARITY: Contains 1 immunoglobulin-like domain.
                                                                                                                     385

the localization of B-cell interactions. May be involved in the localization of B-cells in lymphoid tissues. Binds sialylated glycoproteins; one of which is CD45. Preferentially binds to alpha2, -linked sialic acid. The sialic acid recognition site can be masked by cis interactions with sialic acids on the same cell surface. Upon ligand induced tyrosine phosphorylation in the immune response seems to be involved in regulation of B cell antigen receptor signaling. Plays a role in positive regulation through interaction with Src family tyrosine kinases and may also act as an inhibitory receptor by recruiting cytoplasmic phosphatases via their SH2 domains that block signal transduction through dephosphorylation of signaling molecules.

1. SUBUNIT: Predominantly monomer of isoform CD22-beta. Also found as heterodimer of isoform CD22-beta and a shorter isoform. Interacts with proper cells is soform CD22-beta and a shorter isoform.
                                                                                                                                                                                                                                                                                                                                                                                                                                              ++
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        +

                                          PTM: Phosphorylated on tyrosine residues by LYN (I SIMILARITY: Belongs to the immunoglobulin superfan (stalic acid binding Ig-like lectin) family.

SIMILARITY: Contains 6 immunoglobulin-like C2-type SIMILARITY: Contains 1 immunoglobulin-like V-type CAUTION: Ref. 4 sequence differs from that shown du frameshift in position 806.

DATABASE: NAME-PROW: NOTE-CD guide CD22 entry;
                                                                                                                                                                                                       Name=CD22-alpha;
IsoId=P20273-2; Sequence=VSP_002531;
TISSUE SPECIFICITY: B lymphocytes.

TISSUE SPECIFICITY: B lymphocytes.

DOMAIN: Contains 4 copies of a cytoplasmic motif that is referred to as the immunoreceptor tyrosine-based inhibitor motif (ITIM). This motif is involved in downmodulation of cellular responses. The phosphorylated ITIM motif binds to the SH2 domain of PTPM6/SHP-1.

PTM: Phosphorylated both on threonine/serine and tyrosine
                                                                                                                                                                                                                                                                                                                                                                                                                      with PTPN6/SHP-1, LYN, SYK, PIK3R1/PIK3R2 and PLCG1 upon phosphorylation. Interacts with GRB2, INPPSD and SHC1 upo phosphorylation (By similarity). May form a complex with INPPSD/SHIP, GRB2 and SHC1.
SUBCELLULAR LOCATION: Type I membrane protein.

Submitted (APR-2002) to the EMBL/GenBank/DDBJ databases.

Submitted (APR-2002) to the EMBL/GenBank/DDBJ databases.

C -!- FUNCTION: Structural component of the muscle M-line. Myofilament lattice assembly begins with positional cues laid down in the lattice assembly begins with positional cues laid down in the basement membrane and muscle cell membrane. UNC-89 responds to these signals, localizes, and then participates in assembling an c -!- TISSUE SPECIFICITY: Localizes to the middle of A-bands.

C -!- SIMILARITY: Contains 1 DBL-homology (DH) domain.

C -!- SIMILARITY: Contains 49 immunoglobulin-like C2-type domains.

C -!- SIMILARITY: Contains 1 PH domain.

C -!- SIMILARITY: Contains 5 RCSD domains.

It is responsible for the fixed negative electrostatic charge and is involved in the charge-selective ultrafiltration properties. It serves as an attachment substrate for cells. SUBUNIT: Purified perlecan has a strong tendency to aggregate in dimers or stellate structures. It interacts with other basement
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SUBCELLULAR LOCATION: Extracellular. D 52:369-379(1996).

-!- FUNCTION: IMPORTANT IN CELL-CELL ADHESION. INTERACTS WITH THE BETA-1 IN LEUKOCYTE-ENDOTHELIAL CELL ADHESION. INTERACTS WITH THE BETA-1 INTEGRIN VLA4 ON LEUKOCYTES, AND MEDIATES BOTH ADHESION AND SIGNAL TRANSDUCTION. THE VCAM1/VLA4 INTERACTION MAY PLAY A PATHOPHYSIOLOGIC ROLE BOTH IN INMUNUME RESPONSES AND IN LEUKOCYTE EMIGRATION TO SITES OF INFLAMMATION.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                       FUNCTION: Cell adhesion molecule with an important role in the development of the nervous system. Involved in neuron-neuron adhesion, neurite fasciculation, outgrowth of neurites, etc. Binds to axonin on neurons (By similarity).

SUBCELCULAR LOCATION: Type I membrane protein.
TISSUE SPECIFICITY: Expressed in postmitotic neurones in 16-36 hour embryos, including those in the brain, cranial ganglia and
                                                                                                                                                                                                                                                                                                                                            initiation of axonogenesis in 16-36 hour embryos.
SIMILARITY: Belongs to the immunoglobulin superfamily.
Ll/neurofascin/NgCAM family.
SIMILARITY: Contains 6 immunoglobulin-like C2-type domains.
SIMILARITY: Contains 5 fibronectin type III domains.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                MISCELLANEOUS: The sequence shown is the Kern-/Oz-/Mcg- chain found in proteins SH, X, and NIG-64. The Kern protein has the Kern+ marker, the NEWM protein has the Oz+ marker, the Mcg protein has the Kern+ marker, and the Mcg+ marker.

MISCELLANEOUS: Six tandem lambda-type genes were identified and the John the Mcg sequenced. These correspond to the Mcg sequenced (lambda-1), the Kern-/Oz- sequence (lambda-2) and the Kern-/Oz-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      sequence (lambda-3).
SIMILARITY: Contains 1 immunoglobulin-like domain.

                                                                                                                                                                                                                                                                                                                                                                                                                                                of phagocytosis, mast cell activation and dendritic cell activation. CD47 binding prevents maturation of immature dendritic cells and inhibits cytokine production by mature dendritic cells. SUBUNIT: Binds PTPN11 when tyrosine-phosphorylated, except in macrophages, where it primarily binds PTPN6. Binds GRB2 in vitro. Binds FGR (By similarity). Binds JAK2 irrespective of its phosphorylation status and forms a stable complex. Binds SCAP1 and/or SCAP2. The resulting complex recruits FYB. Binds PTK2B. SUBCELIULAR LOCATION: Type I membrane protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Immunol. 167:2547-2554 (2001).

Immunol. 167:2547-2554 (2001).

FUNCTION: Immunoglobulin-like cell surface receptor for CD47. Acts as docking protein and induces translocation of PrDN6, PTPN11 and other binding partners from the cytosol to the plasma membrane. Supports adhesion of cerebellar neurons, neurite outgrowth and glial cell attachment. May play a key role in intracellular signaling during synaptogenesis and in synaptic function (By similarity). Involved in the negative regulation of receptor tyrosine kinase-coupled cellular responses induced by cell adhesion, growth factors or insulin. Mediates negative regulation and service of the coupled cellular responses induced by cell achieves the coupled cellular responses induced by cellular responses ind
